Hackathon Project Proposal

Project Title: OneNation – Unified Public Welfare & Governance Platform

Chosen Track: Digital Governance & Administration

Problem Statement

Public welfare services such as reporting potholes, civic issues, public safety threats, and accessing emergency assistance are currently handled through multiple disconnected platforms, helplines, and manual processes. This fragmentation results in delayed responses, lack of transparency, poor inter-department coordination, and reduced citizen trust in governance systems. There is a need for a single, centralized software platform that enables citizens to report issues, access emergency services, track resolutions, and interact with authorities, while providing government bodies with real-time dashboards, analytics, and automated workflows to ensure efficient, transparent, and accountable public service delivery. The efficiency and effectiveness of governance and administration in the current day scenario is delayed and fragmented.

Proposed Solution

OneNation is a unified public welfare and governance application designed to act as a single digital interface between citizens and government authorities. The platform consolidates civic issue reporting, emergency response, public service requests, and government communication into one secure and scalable system.

Key Features

1. Blood Bank Directory
2. Civic Issue Reporting (potholes, sanitation, streetlights, water supply, etc.)
3. Real-time complaint tracking and status updates
4. Government alerts and public announcements
5. Role-based dashboards for authorities
6. Analytics and heatmaps for data-driven decision-making
7. User authentication and secure data handling

Target Users

Citizens, municipal authorities, emergency response teams, and government administrators and authorities.

Technology Stack (Proposed)

1 Frontend: Web/Mobile App (React)
2 Backend: Node.js
3 Database: MongoDB
4 APIs: Maps & Location Services, Voice-to-text API
5 Hosting: Cloud-based infrastructure

Impact & Social Relevance

The proposed system improves public welfare by ensuring faster response times, enhanced transparency, better citizen participation, and efficient governance and administration. It supports the principles of good governance by enabling accountability, inclusivity, and data-driven policy decisions.
